

**AMENDMENTS TO THE SPECIFICATION WITH MARKINGS TO SHOW
CHANGES MADE**

Add the following paragraphs after paragraph [0045]:

[0045.1] --FIG. 6a is an enlarged detailed view of an area encircled in FIG.6 and marked A:--.

[0045.2] --FIG. 6b is a perspective view of a motor pot of the linear drive of FIG. 6 for connection to a housing, illustrating the presence of at least one locking tooth:--.

[0063] -- Fig. 6 shows the linear drive 10 with detached motor pot 12. Fig. 6 further shows the housing 11 provided with external threads 32. Thus, the motor pot 12 is provided with matching internal threads 32a so that the motor pot 12 is secured to the housing 11 through rotation.--.

[0065] -- The individual teeth of the radial tooth system 33 have each a flat flank 33a and a steep flank 33b, as shown in Fig. 6a. The motor pot 12 has at least one locking tooth 33c (Fig. 6b) so that the individual teeth of the radial tooth system 33 can be skipped when the motor pot 12 is turned. In a particular position, it is no longer possible to further turn the motor pot 12. A detachment by turning from the threads 32 of the housing 11 is also not possible.--.
